                                                                                                                                                                                                                                                                                                                                                                                                    The sequence represents the amino acid sequence of cyclic peptide inhibitor #33 of lymphocyte function associated antigen-1 and intracellular adhesion molecule (LFA-1/ICAM-1) interaction. A composition comprising a cyclic peptide inhibitor of LFA-1/ICAM-1 interaction is useful for treating haematopoietic neoplastic disease, myocardial infarction, radiation injury, asthma, rhemanciod arthrits or lymphoma metastasis. The composition is also useful for inhibiting in a subject the interaction between LFA-1 expressed on a leukocyte and ICAM-1 expressed on another cell, preventing retinoic acid syndrome in a subject receiving all-trans retinoic acid, inhibiting growth of leukaemia cells, inhibiting drowth of leukaemia cells, a candidate compound for binding to ICAM-1
                                                                                                                                                                                                                                                                                                           Composition comprising a cyclic peptide inhibitor of lymphocyte function associated antigen-1 and intracellular adhesion molecule 1 interaction, for treating e.g. asthma and myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       3. 5

The present sequence is that of a novel alpha-IID beta-3 integrin (glycoprotein IID/IIIa or CD41/CD61) activating peptide. This cyclic peptide comprises a consensus binding motif (Val-Pro-Trp) and was identified by focusing a phage library screening on integrin ligands which are not blocked by a GROB peptide. The VPW motif is present in the A3-domain of von Willebrand factor (VWf), suggesting that VMf is an interaction. The invention relates to the use of novel peptides (see ABP54823-25) comprising the consensus binding motif as pharmaceuticals for the treament of thrombotic diseases and bleeding disorders, including von Willebrand disease, and in artificial tissue transplants to aid in wound healing and tissue regeneration (all claimed)

    .5

The present sequence is that of a novel alpha-IIb beta-3 integrin (glycoprotein IIb/IIIa or CD41/CD61) activating peptide. This cyclic peptide comprises a consensus binding motif (Val-Pro-Trp) that was identified by focusing a phage library screening on integrin ligands, which are not blocked by a GRODS peptide. The motif is present in the A3-domain of von Willebrand factor (VWF), suggesting that VWF is an interaction. The invention relates to the use of novel peptides interaction. The invention relates to the use of novel peptides comprising the consensus binding motif as pharaceuticals for the recatnent of thrombotic diseases and bleeding disorders, including von Willebrand disease, and in artificial tissue transplants to aid in wound healing and tissue regeneration (all claimed)
                                                                                                                                          New alphalIb beta3 integrin activating peptides useful for manufacturing a composition for treating or preventing thrombotic or bleeding disorders, e.g. von Willebrand disease, and in wound healing and tissue regeneration.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence Sequence Sequence

PREVENTION OF HIV INFECTIONS, ANTIBODIES AND METHOD OF
DIAGNOSIO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                  Sequence 49, Application US/09722250D

Sequence 49, Application US/09722250D

Patent No. 6610651

GENERAL INFORMATION:

APPLICANT: Rasqualini, Renata

TITLE OF INVENTION: Molecules that Home to Various Selected Organs or

TITLE OF INVENTION: Tissues

FILE REPERENCE: P-L4 4514

CURRENT APPLICATION NUMBER: US/09/722,250D

CURRENT APPLICATION NUMBER: US 09/042,107

PRIOR PFILING DATE: 1998-03-13

NUMBER OF SEO ID NOS: 437

SOFTWARE: Patentin Ver. 2.0

Sequence 214, Application US/09258754

Patent No. 6174687

GENERAL INFORMATION:
APPLICANT: Rajet, Daniel
APPLICANT: Rajet, Daniel
APPLICANT: Rajet, Daniel
APPLICANT: Rajet, Daniel
APPLICANT: Membrane Dipeptidase
FILE REPERENCE: P-LJ 3443
CURRENT APPLICATION NUMBER: US/09/258,754
CURRENT APPLICATION NUMBER: US/09/228,754
CURRENT FILING DATE: 1999-0-2-6
EARLIER FILING DATE: 1998-03-13
NUMBER OF SEQ ID NOS: 452
SOFTWARE: Patentin Ver. 2.0
                                                                                                                                                                                                                                                                                   Sequence 42, Application US/09258754

Sequence 42, Application US/09258754

Sequence 42, Application US/09258754

GENERAL INFORMATION:

APPLICANT: Rucelahri, Erkki

APPLICANT: Rajotte, Daniel

TITLE OF INVENTION: Merhods of Identifying Lung Homing Molecules Using

TITLE OF INVENTION: Membrane Dipeptidase

FILE REFERENCE: P-LJ 3443

CURRENT APPLICATION UNBER: US/09/258,754

CURRENT FILING DATE: 1999-02-26

EARLIER PILING DATE: 1998-03-13

6: the number of results predicted by chance to hav

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PH0926
T-cell receptor beta chain V-D-J region (isolate 12) - rat (fragment)
C;Species: Rattus norvegicus (Norway rat)
C;Species: Rattus norvegicus (Norway rat)
C;Accession: PH0926
R;Gold, D.P.; Offner, H.; Sun, D.; Wiley, S.; Vandenbark, A.A.; Wilson, D.B.

"A novel D-leucine-containing Conus peptide: diverse conformational dynamics in the contryphan family.";

J. Pept. Res. 54:33-99(1999).

- SUBCELLULAR LOCATION: Secreted.

- TISSUE SPECIFICIE: Expressed by the venom duct.

- MASS SPECIFICM: Expressed by the venom duct.

- MASS SPECIFICMENTY: MAR-888 4; METHOD=LSIMS.

- SMILARITY: Belongs to the contryphan family.

Nucleic Acids Res. 18:17-21(1990).
--- FUNCTION: Repair of alkylated guanine in DNA by stoichiometrically transferring the alkyl group at the 0-6 position to a cysteine residue in the enzyme. This is a suicide reaction: the enzyme is ireversibly inactivated.
--- CATALYTIC ACTIVITY: DNA (containing 6-0-methylguanine) +
[protein]-L-cysteine = DNA (without 6-0-methylguanine) + protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  S-methyl-i-cysteine.

-- FUNCTION: Inhibits the neuronal noradrenaline transporter.
-- SUBCELLUIAR LOCATION: Secreted.
--- IISSUE SPECIFICITY: Expressed by the venom duct.
--- RISSUE SPECIFICITY: Expressed by The venom duct.
--- SIMILARITY: Belongs to the chi/lambda-conotoxin family.
Neurotoxin; Toxin; Hydroxylation.

and of the stick insect Extatosema tiaratum assigned by tandem fast

to combardorhina portenenty.";

Blot. Chem. HOppe-Sevier 371:345-354(1990).

Collevate the level of trehalose in the hemolymph (trehalose is the major carbohydrate in the hemolymph of insects).

Collevate the level of the AKH / HRTH / RPCH family.

WPI; 2001-442248/47.

Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine residues.

Claim 49; Page 32; 102pp; English.

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VBGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a

Example 25; Page 47; 102pp; English.

```
peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptides (comprising 2 linked monocyclic conversation are used to interfere with angiogenesis, co cyclisation are used to interfere with angiogenesis, condition is diabetic retinopathy, psoriasis, arthropathy. The condition is diabetic retinopathy, psoriasis, arthropathy, recentered by angiogenesis, neovascularisation or lymphangiogenesis. The condition, is diabetic retinopathy, psoriasis, arthropathy, creceptovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive crauma, substance-induced neovascular sequelae, or chronic liver sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic or brain. The peptides are used to image blood vessels and lymphatic curbant at least one biological activity induced by VEGF-C or -D and care also used in combination with an anti-inflammatory agent, to treat a structure. The contractory agent, to treat a structure contractory and arthritis, psoriasis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human whose 3-dimensional structure is modelled on the expose loop of human concern of producing a monomeric monocyclic peptide by a measuring beta-beta carbon separation distances on opposite antiparallel strands of a cyclising the peptides of meric bicyclic peptides no especially oxidishing the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior peptides) and a cyclic peptide with at least one amino acid deleted prior comparaterisation or lymphanglogenesis, na mammal with a condition characterised by anglogenesis, neovascularisation or lymphanglogenesis, neovascularisation or lymphanglogenesis, neovascularisation or lymphanglogenesis. The manual was diabetic retinopathy, psoriasis, arthropathy, hemangloma, vascularised malignant or benign tumour, post recovery cerebrovascular accident, post-mignopathy restenosis, head, heat or cold crauma, substance-induced neovascularisation of the liver, excessive trauma, substance-induced neovascularisation of the liver, excessive corporate anglogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, nypertension induced neovascular sequelae, or chronic liver corporation in peripheral limbs or in lungs, peritoneal cavity, pleura, accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic current a least one biological activity induced by VEGF. Or -D and cremonic inflammation, especially rheumatoid arthritis, psoriasis and cremonic arthritis and crivity induced by VEGF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0;

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human whose 3-dimensional structure is modelled on the expose loop of human C whose 3-dimensional structure is modelled on the expose loop of human composed on the control of producing a monomeric monocyclic peptide by a measuring beta-character of producing a monomeric monocyclic peptide by a measuring beta-character of peptide by oxidising the cysteine residues. The monocyclic peptides in meric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior complication are used to interfere with anglogenesis.

The conditionistion or lymphanjogenesis in a mammal with a condition characterised by anglogenesis, neovascularisation or lymphangiogenesis.

The condition is diabetic retinopathy peoriasis arthropathy.

The mangioma, vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-angloplasty restenosis, head, heat or cold formula. The condition is the liver, excessive commune.

                                                                                                                                                                                                                             Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           hormone related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

The sequence represents a monomeric monocyclic peptide or the invenition, whose 3-dimensional structure is modelled on the expose loop of human veger (vascular endochelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta-expect of producing a monomeric monocyclic peptide by a measuring beta-expect of peptides of producing a monomeric monocyclic peptide such strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptides (comprising 2 linked monocyclic certovatilarisation or lymphangiogenesis, neovascularisation or lymphangiogenesis, neovascularisation or lymphangiogenesis.

The condition is diabetic retinopathy, psoriasis, arthropathy, cerebrovascular accident, post-recovery cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive corporation. The peptides are also used to modulate vascular permeability corporation in peripheral limbs or in lungs, peritoneal cavity, pleura, accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, corporation in peripheral limbs or in lungs, peritoneal cavity, pleura, corporation in peripheral limbs or in lungs, peritoneal cavity, pleura, corporation in peripheral limbs or in lungs, peritoneal cavity, pleura, corporation inflamention, especially rheumatory agent, to treat a condition especially rheumatory agent, to treat a corporation especially rheumatory agent, to treat a corporation especially rheumatoid arthritis, psoriasis and acciding archivors.
                                                                                                                                                                                                                                                                                                                       Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sequence represents a monomeric monocyclic peptide of the invention,

The sequence represents a monomeric monocyclic peptide of the invention, compose 3-dimensional structure is modelled on the expose loop of human vector whose 3-dimensional structure is modelled on the expose loop of human vector period a monomeric monocyclic peptide by a measuring beta-competed of producing a monomeric monocyclic peptide by a measuring beta-competed loop fragment from an exposed loop of a growth factor protein and peptides limeric bicyclic peptides with a least one amino acid deleted prior cyclising the peptides with a least one amino acid deleted prior peptides) and a cyclic peptide with at least one amino acid deleted prior cyclising the peptides (comprising 2 linked monocyclic peptides) and a cyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptides with at least one amino acid deleted prior correcterised by angiogenesis in a mammal with a condition characterised by angiogenesis in a mammal with a condition of abbetic retinopathy, psoriasis, arthropathy, cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive cerebrovascular angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver competides are also used to monditate wacular permeability accumulation in peripheral limbs or in lungs, peritomeal cavity, pleura, cor brain. The peptides are used to image blood vessels and lymphatic cor with at least one biological activity induced by vEGF, vEGF or -D and are also used in combination with an anti-inflammatory agent, to treat a correct or perior certification with an anti-inflammatory agent, to treat a disparic retinance in a mammal sequelae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
diabetes induced neovascular sequelae, rheumatoid arthritis; diabetic retinopathy; chronic inflammation; cyclic.
                                                                                                                                                            /note= "This bond cyclises the peptide"

the sequence represents a monomeric monocyclic peptide of the invention, whose 3 dimensional structure is modelled on the expose loop of human upone of the sequence of producing a monomeric monocyclic peptide by a measuring betamethed of producing a monomeric monocyclic peptide antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclising the cysteine residues. The monocyclic peptides and a cyclic peptide with at least one amino acid deleted prior cyclisation are used to interfere with angiogenesis, condition characterised by angiogenesis in envascularisation or lymphangiogenesis in a mammal with a condition or characterised by angiogenesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, peoriasis, nead, head, hormone-related angiogenic dysfunction, diabetes induced neovascular condition when an induced neovascular meaners in head, hypertension induced neovascular promoners are substanced angiogenic dysfunction, diabetes induced neovascular promoners in the properties of the monomers of the peptide of the monomers of the petide of the petide of the monomers of the petide of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           infection. The peptides are also uncontaints are infection. The peptides are also uncontaints in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity pleura, or brain. The peptides are used to inage blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF. VEGF-C or -D and are also used in combination with an anti-inflammatory agent, to treat a

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGFO (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta petachen separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                        Human; VEGF; vascular endothelial growth factor; angiogenesis;

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human UNGC VEGFD (vascular endothelial growth factor). The invention relates to a peta carbon separation distances on opposite antiparallel strands of a beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidiaing the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior or cyclisation are used to interfere with angiogenesis,

The condition of lymphangiogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis.

The condition is diabetic retinopathy, psoriasis, arthropathy, the condition is diabetic retinopathy, psoriasis, arthropathy, cerebrovascular accident, post-angioplasty restenosis, head, heat or cold
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                             Human; VEGF; vascular endothelial growth factor; angiogenesis;
                                                                                                                                                                                                                                                                     neovascularisation; lymphangiogenesis; psoriasis; tumour; diabetes induced neovascular sequelae; rheumatoid arthritis; diabetic retinopathy; chronic inflammation; cyclic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /note= "This bond cyclises the peptide"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Hughes RA, Stacker S, Cendron A;
                                                                                                                                                                                                                                                                                                                                                                                                                             Location/Qualifiers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 49; Page 32; 102pp; English.
                                           AAU04529 standard; peptide; 9 AA.
                                                                                                                                                                                                  VEGF based monocyclic peptide 7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (LUDW-) LUDWIG INST CANCER RES
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             18-JAN-2001; 2001WO-US001533.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             18-JAN-2000; 2000US-0176293P.

ARRSB412-42 are overlapping 8-mer peptides of the binding domain of TSAR (Totally Synthetic Affinity Reagents) peptide TSAR C46.9-2 (AARSB411). These bind (partially) a monoclonal antibody, ie. anti-CRA C46 (anticarcincembryonic antigen). TSAR peptides are generated using generic oligonucleotides (see AAQ/V470-73 for examples). TSARs are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker peptide between the 2 domains. The TSARs or
                                                                                                                                                                                                                                                                                                 ö
            hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VBGF, VBGF-C or D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthitis, psoriasis and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a nucleic acid molecule encoding an ovarian cancer antigen, CA125. Nucleic acid molecules, vaccine and methods are useful for diagnosing, preventing and treating cancer, e.g. pencreatic, lung, ovarian, breast or endometrial carcinoma. The invention is useful in gene therapy and as vaccines. The present sequence is CA125/MUC16 Oglycosylation site
a chemically or biologically active moiety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or invivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process. (Updated on 25-MAR-2003 to correct PN

This sequence represents a core peptide of an src homology region 2 (SH2) binding peptide corresponding to the formula: 27-X-28-X X = any D- or L-amino acid; 27 = phosphotyrosine or its isostere; 28 = asparagine or its isostere; the amino terminus is acylated, and the peptide is less than 14 residues in length, with the proviso that if 27 is phosphotyrosine and 28 is asparagine, then the peptide is not GOZZYZSARLLL. SH2 binding peptides containing this core peptide are used to treat of diagnose diseases associated with aberrant cell growth, differentiation or regulation which is associated with defects in receptor tyrosine kinase pathways, by partially blocking or inhibiting a cellular signal transduction pathway. The disease may be cancer, a developmental or differentiation disease or insulin-resistant (or non-insulin dependent)
                                                                                                                  Core peptide; src homology region 2 binding peptide; SH2; cell growth; differentiation; regulation; receptor tyrosine kinase pathway; cancer; signal transduction pathway; non-insulin dependent diabetes; insulin-resistant diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     N. meningitidis LOS peptidic mimotope related peptide SEQ ID NO:155.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Neisseria meningitidis; meningococcus; meningococcal; vaccine; LOS; lippoligosaccharide; monoclonal antibody; antibacterial; infection; antiinflammatory; meningococcal disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Peptide(s) which bind to SH2 domains - are used to treat diseases associated with aberrant cell growth, differentiation or regulation associated with defects in receptor tyrosine kinase pathways.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequences given in AMM12551-70 represent core peptides of an src homology region 2 (SH2) binding peptide which correspond to the formula:

27-X-Z8-X X = any D- or I- amino acid; Z7 = phosphotyrosine or its isostere; Be asparagine or its isostere; the amino terminus is a sostere; Z8 = asparagine or its isostere; the amino terminus is a cylated, and the peptide is less than 14 residues in length, with the proviso that if Z7 is phosphotyrosine and Z8 is asparagine, then the peptides is not G827XZSYPLIL. SH2 binding peptides containing these core peptides are used to treat of diagnose diseases associated with aberrant cell growth, differentiation or regulation which is associated with cell growth, differentiation or regulation which is associated with cinhibiting a cellular signal transduction pathway. By partially blocking or inhibiting a cellular signal transduction pathway. The disease may be cancer, a developmental or differentiation disease or insulin-resistant (or non-insulin dependent) diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The present invention describes mimotopes (I) of a surface L3, 7, 9, of meningococcal lipopolysaccharides (LOS) of Neisseria meningitidis
meningococcal lipopolysaccharides (LOS) of Neisseria meningitidis
comprising a peptide epitope obtained by screening a peptide library with
comprising a peptide epitope obtained by screening and peptide library with
H44/78. (I) is antigenically cross-reactive with MAD. (I) have
H44/78. (I) is antigenically cross-reactive with MAD. (I) have
continued antiinflammatory activities, and can be used in
continued as medicament, and also in the manufacture of a medicament for
cuseful as a medicament, and also in the manufacture of a medicament for
treating or preventing meningococcal disease. (I) and MAB are useful for
treating a patient suffering from or susceptible to meningococcal disease
contracting meningococcal infection to detect antibodies against L3, 7, 9,
assay for meningococcal infection to detect antibodies against L3, 7, 9,
assay for meningococcal infection to detect antibodies against L3, 7, 9,
assay for meningococcal infection to detect antibodies against L3, 7, 9,
assay for meningococcal infection to detect antibodies against L3, 7, 9,
assay for meningococcal infection to detect antibodies against L3, 7, 9,
assay for meningococcal infection to detect antibodies against L3, 7, 9,
assay for meningococcal infection to detect antibodic against L3, 7, 9,
assay for meningococcal infection to detect antibodic sample from a patient. ANNB8464 to ABN88487 and ABP47336 to ABB47754
creptesent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA encoding CAI resistance proteins - used in gene therapy, and for detecting CAI resistance in biological samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Carboxyamido-triazole resistance; CAI; CAIR-1; cancer; gene therapy; Src homology 3; SH3 binding domain.
                                                                                                                                                                                          Novel mimotope of Neisseria meningitidis surface, for treating meningococcal disease, comprising a peptide epitope obtainable by screening peptide library with a specific monoclonal antibody.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes mimotopes (I) of a surface Li, 7, 9, of meningococcal lipopolysaccharides (LOS) of Neisseria meningitidis
comprising a peptide epitope obtained by screening a peptide library with comprising a peptide epitope obtained by screening a peptide library with a monoclonal antipody (WAD) like 48B12C10, H44/24, H44/58, H44/70 or H44/78. (I) is antigenically cross-reactive with MAD. (I) have antipocterial and antihinflammatory activities, and can be used in antipocterial and antihinflammatory activities, and can be used in caseful as a medicament for useful as a medicament for treating or preventing meningococcal disease. (I) and MAB are useful for treating a patient suffering from or susceptible to meningococcal disease treating a patient suffering from to susceptible to meningococcal infection to detect antibodies against Li, 7, 9, and 10.05 and to detect the presence of Li, 7, 9 immunotype meningococcus in a completion a patient.
